Pressductor Radial load cells

Introduction

ABB's Pressductor® Radial load cells (PRT load cells) are sensitive and accurate yet rugged, reliable and compact. They can withstand high overloads and vibrations, and operate over a wide range of tensions: ideal for any web converting application such as coating, laminating, printing, slitting, winding/unwinding and many others.

The well-proven Pressductor load cells combined with the tension electronics, offer an easy-to-use/ user-friendly web tension measurement system with superior long term performance leading to higher productivity and product quality and higher profit for the web producer.

Increased process uptime

In a web process running continuously, every minute of production time is precious. Even so, no production line runs without downtime.

With Pressductor Radial load cells the risk of web breaks can be reduced to a minimum, thus leaving as much time as possible for real production.

Thanks to a strong and stable signal deriving from the PRT load cells, the upcoming web breaks are kept to an absolute minimum level.

Tighter product tolerances

The ability to produce web to tighter tolerances minimizes the costs associated with non-conforming web. It also increases the web producer's accessible market to include products with tighter tolerance requirements.

A Pressductor transducer produces its measurement signal without requiring any physical movement in the transducer measurement element. And it generates a strong signal at comparatively low stress levels. So there is no possibility of fatigue leading to drift and deteriorating measurement performance.

Pressductor Radial load cells

50 years of experience

—
01 Pressductor technology – mechanical force alters magnetic field.

—
02, 03, 04 Typical PRT load cell installations.

Minimize maintenance

Share the experience, of virtually maintenance-free load cells, with thousands of other Pressductor load cell users. A robust load cell design with no fragile or ageing components makes this possible. Thanks to its robust and compact design, the PRT load cells work consistently for many years without any need for maintenance.

Fast access to support and service

ABB provides customers with superior distinctive after sales service that really differentiates from the competition. You obtain advanced solutions to problems, service and professional consultation through our After Sales Service program. Expert engineers with extensive experience of all types of Force Measurement products are available to assist you through our world-wide network.

There is a shaft-mounted PRT tension measurement load cell suitable for most web processing machinery used in the converting, printing, plastic film, textiles, and other industries.

In the converting industry, the PRT load cells are ideal on machinery for coating, laminating, embossing, and many other processes.

PRT load cells are used on a wide range of printing presses – in both converting and commercial printing as well as newspaper and magazine production.

In the plastics industry, PRT load cells are used to optimize the production and processing of blown and cast film.

And in the textiles industries, machinery applications include nonwovens production as well as finishing operations like bleaching, desizing, dyeing, and printing.

In all web processing areas, PRT load cells are used on the full range of winding machinery, from unwinders to slitter-rewinders.

The Pressductor difference

Like ABB's other load cells based on Pressductor Technology, PRT load cells rely on electromagnetic changes in the transducer, not on physical movement, to sense fluctuations in web tension. The Pressductor Technology operating principle provides exceptional improvements in load cell performance characteristics, including reliability (notably absence of drift), durability, repeatability, and wider measurement range.

Machined from a solid block of steel, the load cells are rugged and stiff, affording high overload protection as well as an extended measurement range above the nominal load. And they do not contribute to machine vibration, even at high speeds.

Since the transducer action – the magnetic flux – takes place inside a steel core, environmental factors like dirt or fluids can't degrade performance and reliability. These stainless steel load cells don't require any physical seals.

Furthermore, low transducer impedance – less than a couple of ohms – helps eliminate susceptibility to radio-frequency and electromagnetic interference.

Pressductor Radial load cells

Simple to size and easy to apply

—
01 Measurement
directions.

Designers appreciate:

- Remarkably high spring constant
- Very narrow profile
- High reliability

Operators value a load cell with:

- No drift
- No need for recalibration
- No failures
- High reliability

Selecting and sizing load cells

Calculating the forces exerted on load cells in a specific application allows you to determine the ideal load cell size specification. Force calculations and load cell sizing are typically conducted in collaboration with ABB; this page provides an overview of the considerations that play a role in this stage of the specification process.

The orientation of PRT load cells on the end of the roll shaft can be adjusted to perform measurements in the most advantageous direction for each application.

In sizing PRT load cells, both the web tension and the weight of the roll and bearings (tare weight) should be considered. If the load cell is oriented vertically or diagonally with respect to the force of gravity, the tare force will contribute to the total force level sensed by the PRT load cell system. If the load cell is oriented horizontally, the tare force will be perpendicular to the measurement axis, and so will not be sensed.

Calculating the forces

The PRT load cell measures bi-directionally along its measurement axis (see illustration). Once the load cell is oriented and the measurement axis determined, the force components exerted on the load cells of a roll are easily calculated as functions of the web tension, tare force, and deflection angles. Since most systems involve two load cells, the calculated forces are divided by 2 to obtain the forces exerted on each individual load cell. The illustrations on this spread show three scenarios, involving horizontal, vertical and diagonal measurement axes.

When horizontal, the measurement force (F_{Rtot}) is a function of just the tension in the web (T) and the deflection angles (α and β). Since the weight of the roll and bearings ($Tare$) is not sensed, the load cells can be sized to measure low tension levels even on a comparatively heavy roll. However, the perpendicular force (F_{Vtot}) – which does include $Tare$ – should not exceed the overload rating.

When the measurement force (F_{Rtot}) is vertical, it includes the weight of the roll and bearings ($Tare$), and the load cell must be sized accordingly. In effect, the weight of the roll and bearings are using up some of the measurement range of the load cell.

A diagonal load force orientation requires a more complex calculation. Here, the forces sensed in both the measurement direction and the perpendicular direction include a portion of the tare as well as the web tension, and the angle formed by the measurement axis and the horizontal axis (γ) enters into the calculation.

Application hint

Two 10 % application guidelines are useful in selecting load cell sizes:

1. The proportion of web tension that is actually sensed by the load cell should be at least 10 % of total web tension. For operational conditions producing values below 10 %, consult ABB.
2. During normal operation, the sensed force should not be less than 10 % of the load cell's capacity.

Horizontal measuring load cells

$$F_{Rtot} = F_R = T(\cos\beta - \cos\alpha)$$

$$F_{Vtot} = F_V + Tare = T(\sin\beta + \sin\alpha) + Tare$$

Vertical measuring load cells

$$F_{Rtot} = F_R + Tare = T(\sin\alpha + \sin\beta) + Tare$$

$$F_{Vtot} = F_V = T(\cos\alpha - \cos\beta)$$

Diagonal measuring load cells

$$F_{Rtot} = T(\cos(\beta + \gamma) - \cos(\alpha - \gamma)) - Tare \times \sin\gamma$$

$$F_{Vtot} = T(\sin(\alpha - \gamma) + \sin(\beta + \gamma)) + Tare \times \cos\gamma$$

F_R	=	Force component of Tension in the measuring direction
F_{Rtot}	=	Total force in the measuring direction
F_V	=	Force component of Tension transverse to the measuring direction
F_{Vtot}	=	Total force in the transverse direction
T	=	Tension in web
$Tare$	=	Weight of roll and bearings
α, β	=	Deflection angles
γ	=	Angle for load cell mounting

Pressductor Radial load cells

Designed to measure web tension

Four standard sizes measure web tension from 0.1 to 100 kN. With its extended-capacity feature, the PRT load cell is capable of measuring tension reliably over a 30:1 range. Superior overload characteristics in all force directions (up to 500 %) eliminate overload failures for all practical purposes.

Exceptionally high spring constant virtually eliminates load cell contributions to machine vibration, even at very high machinery speeds. The performance of the load cells is unaffected by environmental factors like dust, corrosion and radio or electromagnetic interference.

Designed to measure web tension on most types of web processing machinery used in the converting, plastic film, printing, textiles, and other industries.

All load cells

Operating principle		Electromagnetic Pressductor technology
Accuracy class ⁴	%	±0.5
Repeatability error	%	<±0.1
Operating range		30:1
Stainless steel	SIS	2387 ⁵
	DIN	X4CrNiMo165
Working temperature range		–10 to 80 °C 14 to 176 °F
Zero point drift ⁶	%/°C	<±0.015
	%/°F	<±0.008
Sensitivity drift ⁶	%/°C	<±0.015
	%/°F	<±0.008

Extended-Range Operation Beyond their nominal capacity, PRT load cells have an extended range of measurement – so they can be sized for normal, as opposed to maximum, tension levels. As a result, they can process a wider variety of materials.

¹ Values indicate the total capacity of the load cells when taking into account their permissible extended capacity. In the extended range, above the nominal load, some small decline in measurement accuracy may be experienced.

² Maximum permitted loads without affecting load cell calibration.

³ At nominal load.

⁴ Accuracy class is defined as the maximum deviation, and is expressed as a percentage of the sensitivity at nominal load. This includes linearity deviation, hysteresis and repeatability error.

⁵ Corrosion resistance properties similar to AISI 304.

⁶ Applies for 20 to 80 °C (68 to 176 °F).

Pressductor Radial load cells

Shaft sizes and bearing recommendations

—
01 The bearing is press fit to the roll shaft, and the assembly is slip fit to the load cell and secured with snap rings.

—
02 Integration of load cell and shaft.

PRT load cells work well with both rotating (live) and non-rotating (dead) shafts. For live shaft applications, many different bearing types and sizes can be used. The load cell and the shaft can be integrated by first press-fitting the selected bearing onto the shaft and then sliding the assembly into the center hole of the PRT load cell. Or, alternatively, the roll shaft may be machined to create a shoulder that one side of the bearing rests against, while the other side is restricted by a snap ring.

In live shaft assemblies, the roll is held securely in place by snap rings installed in grooves on each side of the bearing in the center hole of the load cell. Thermal expansion of the roll is accommodated by installing snap rings on both sides of the bearing in just one load cell.

The table presents a sampling of bearing specifications for PRT load cells for various shaft diameters and bearing types. Other bearing types and sizes can be accommodated, including both conventional SKF bearings and many self-locking Torrington-type bearings.

The table includes typical examples of bearings for a variety of shaft diameters, based on specific load cell capacities, center hole diameters, and bearing widths (distance between snap rings). Of course, bearing load and rotational speed are also important specification criteria that must be considered when selecting an appropriate bearing. Only the bearings for the largest shaft diameters that fit standard PRT load cells are shown; many other options are available. ABB applications engineers can provide assistance with bearing selection.

Application hint

Thermal expansion of the roll is accommodated by installing snap rings on both sides of the bearing in just one load cell.

A = Shaft diameter
B = Load cell hole diameter
C = Distance between snap rings

Pressductor Radial load cells

Mounting options

- 01 Three ways to mount.
- 02 Easy wall mounting.
- 03 For dead shaft rolls ABB provides a dead shaft kit with an adapter that clamps onto the non-rotating roll shaft.
- 04 Grease nipple.

Three ways to mount

PRT load cells mount with equal ease on the inner and outer side of machine walls. In locations where pedestal mounting is required, a specially designed angle bracket extends the usefulness of the radial load cell.

Easy wall mounting

Aligning load cells on opposing machine walls is made easy by fitting the shallow surface protrusion on the load cells' back cover into predrilled cavities in the machine walls. Alternatively, the load cells can be separated from the machine wall with spacers, or bolted to an adapter plate.

01

02

Dead shaft adapter kit

For applications with non-rotating shaft ends ABB provides an optional dead shaft adapter kit for PFRL 101A and PFRL 101B. The kit consists of a self-aligning bearing to manage misalignments, adapter for different shaft diameters and an anti-rotation pin.

Dead shaft adapter kit is available for following shaft diameters: $\frac{3}{4}$ in, 1 in, $1\frac{1}{8}$ in, $1\frac{1}{4}$ in, $1\frac{1}{2}$ in, 20 mm, 25 mm and 30 mm.

—
03**Grease nipple**

ABB recommends to use sealed bearings that will meet most demands in web handling machinery without the need for regular greasing operations. However, if greasable bearings must be used, ABB offers, as an option, grease nipples. This option is available for PFRL 101B, PFRL 101C and PFRL 101D.

Tension electronics

PFEA – the compact solution

Covering a wide range of applications the tension electronics comes in four versions, with different levels of performance and functionality.

—
01 PFEA tension electronics.

—
02 IP20 version for control room cubicle.

—
03 Interactive display.

—
04 IP65 version for mounting on machine.

All four versions have multi-language digital display and configuration keys. The configuration keys being used for setting different parameters and to check the status of the tension system. The 2 × 16 character display can present sum, difference or individual load cell signals. All four versions are available in both DIN-rail version and enclosed IP65¹ version for mounting in more severe environments.

PFEA111

A cost effective, compact and user-friendly tension electronics providing an accurate and reliable fast analog SUM signal from two load cells for control and/or monitoring. The display can show the SUM, individual A & B and difference signal. The small size and DIN-rail mount make this unit very easy to integrate into many types of electrical cabinets.

PFEA112/122

These units provide the same functionality and user friendliness as the PFEA111 with the addition of fieldbus communication via PROFIBUS-DP on PFEA112, and PROFINET RT and EtherNet/IP on PFEA122. On the PFEA122 it is also possible via PROFINET and EtherNet/IP to access the individual A and B signals, besides the SUM signal.

PFEA113

These advanced tension electronics can supply up to four load cells and have six configurable analog out-puts for control and/or monitoring of web tension. It is possible to see both the SUM, individual A & B and difference signal, not only on the display but also on the output signals. The output signals are also available on PROFIBUS-DP.

Another useful feature is the possibility to switch the gain for two different web paths. This unit also includes a self-diagnostic function and four configurable digital outputs for alarms and level detection.

By combining up to three PFEA113, the system can handle segmented roll applications, i.e. winders, with up to 12 load cells.

The high level of functionality and user-friendliness make the PFEA113 one of the most complete tension electronics on the market.

¹ According to IEC 529, EN 60-529

Features and benefits

Interactive menu

The tension electronics has a unique interactive menu which guides the commissioning step by step, eliminating the potential for making mistakes and significantly reducing startup time – a very helpful tool.

Built-in self diagnostics

The electronics continuously supervise a number of important parameters and provides error messages if something goes wrong.

Multi-language display

The multi-language display is a great feature that helps to eliminate mistakes, during start-up and/or operation of the tension system.

Load memory

The resettable load memory stores max. load values.

A useful tool for maintenance.

Analog outputs

The PFEA provide a scaled and zeroed tension output ready for use in control or monitoring. Individual scaling and filtering can be done for each of the analog outputs.

PROFIBUS-DP, PROFINET and EtherNet/IP

PFEA112 and PFEA113 have Fieldbus communication via PROFIBUS DP as standard. PFEA122 comes with PROFINET RT and EtherNet/IP communication. Regardless of the communication protocol used, measurement values and status information will be available.

Filter function

All units come with a selectable filter function for removal of roll unbalance, machine vibrations and other disturbances.

Commissioning without calibration weights

All Pressductor load cells are standard calibrated to the same sensitivity before delivery from ABB factory. This means that the fastest and most accurate way to commission a tension system is to use a calculated value instead of using calibration weights.

Mounting

To provide flexibility of mounting, all four versions of the tension Electronics are available in two mounting alternatives. For mounting on a standard DIN-rail the IP20 and for wall mounting the IP65.

Floor cubicle

Floor cubicle type MNS Select is available for housing of up to 24 pcs. of PFEA111/112/122 or 12 pcs. of PFEA113 when mounted on 19 inch plates. Exact numbers depend on the combination of different tension electronics and the number of optional units used.

Options and dimensions

Options

To meet certain special application requirements the following options are available:

Insulation amplifier PXUB 201

The insulation amplifier can be used when galvanic insulation is required for analog output signals. The insulation amplifier can be connected to all versions and PFEA113 – IP65 can hold up to four PXUB 201.

Supply voltage	24 V (20 to 253 V AC/DC)	
Current consumption	10 mA + external load	
Signal range	Input	Output
	0 to ± 10 V	0 to ± 10 V
	0 to ± 10 V	0 to ± 20 mA
	0 to 10 V	4 to 20 mA
Rated insulation voltage	600 V (basic)	

Relay board PXKB 201

PXKB 201 is DIN-rail mounted and can be mounted in the IP65 versions of the tension Electronics together with the insulation amplifier. PFEA113-65 can hold up to four PXKB 201.

Supply voltage	24 V DC	
Power consumption	18 mA	
Contact data	AC	6 A at 250 V
	DC	6 A at 250 V

Power supply unit

When using the DIN-rail IP20 version of the electronics and 24 V main supply is not available, ABB offers optional power supply units.

The compact units transform main supply from 110 to 120 V/207 to 240 V AC to 24 V DC for supply of the PFEA tension electronics.

Three power supply units with different power ratings are available. The table below indicates max. number of electronics per power supply unit.

	PFEA111/112/122	PFEA113
SD831 3 A	6	3*
SD832 5 A	12	6*
SD832 10 A	24	12*

		30 mm			3BSE025538R30
Connection cables (PVC free)		Cable with female connector, 8 m			3BSE003697R108
		Cable with female connector, 20 m			3BSE003697R120
		Cable with female connector, 30 m			3BSE003697R130
		Cable with female connector, 50 m			3BSE003697R150
		Cable with angular female connector, 8 m			3BSE003697R208
		Cable with angular female connector, 20 m			3BSE003697R220
		Cable with angular female connector, 50 m			3BSE003697R250
Mounting brackets		PFRL 101A/B			3BSE003694R1
		PFRL 101C			3BSE003695R1
		PFRL 101D			3BSE003696R1
Junction box				PFXC 141	3BSE029997R1
Tension electronics	PFEA111, IP20		PFEA111-20		3BSE050090R20
	PFEA112, IP20		PFEA112-20		3BSE050091R20
	PFEA113, IP20		PFEA113-20		3BSE050092R20
	PFEA111, IP65		PFEA111-65		3BSE050090R65
	PFEA112, IP65		PFEA112-65		3BSE050091R65
	PFEA113, IP65		PFEA113-65		3BSE050092R65
	PFEA113, IP65, incl. 1 insulation amplifier PXUB 201 – voltage output (connected to AO1)		PFEA113-65.1PXV		3BSE050092R165
	PFEA113, IP65, incl. 2 insulation amplifier PXUB 201 – voltage output (connected to AO1,2)		PFEA113-65.2PXV		3BSE050092R265
	PFEA113, IP65, incl. 3 insulation amplifier PXUB 201 – voltage output (connected to AO1,2,3)		PFEA113-65.3PXV		3BSE050092R365
	PFEA113, IP65, incl. 4 insulation amplifier PXUB 201 – voltage output (connected to AO1,2,3,4)		PFEA113-65.4PXV		3BSE050092R465
	PFEA113, IP65, incl. 1 insulation amplifier PXUB 201 – current output (connected to AO1)		PFEA113-65.1PXC		3BSE050092R1165
	PFEA113, IP65, incl. 2 insulation amplifier PXUB 201 – current output (connected to AO1,2)		PFEA113-65.2PXC		3BSE050092R1265
	PFEA113, IP65, incl. 3 insulation amplifier PXUB 201 – current output (connected to AO1,2,3)		PFEA113-65.3PXC		3BSE050092R1365
	PFEA113, IP65, incl. 4 insulation amplifier PXUB 201 – current output (connected to AO1,2,3,4)		PFEA113-65.4PXC		3BSE050092R1465
Options					
Insulation amplifier				PXUB 201	3BSC630149R1
Relay board				PXKB 201	3BSC810039R1
Power supply device (3 A)				SD831	3BSC610064R1
Power supply device (5 A)				SD832	3BSC610065R1
Power supply device (10 A)				SD833	3BSC610066R1
Floor cabinet MNS select, sealed IP54					3BSE030582R54
Floor cabinet MNS select, ventilated IP21					3BSE030582R21
